How to Create a GitHub Account and Generate a Personal Access Token

---

Part 1: Creating a GitHub Account

Step 1:

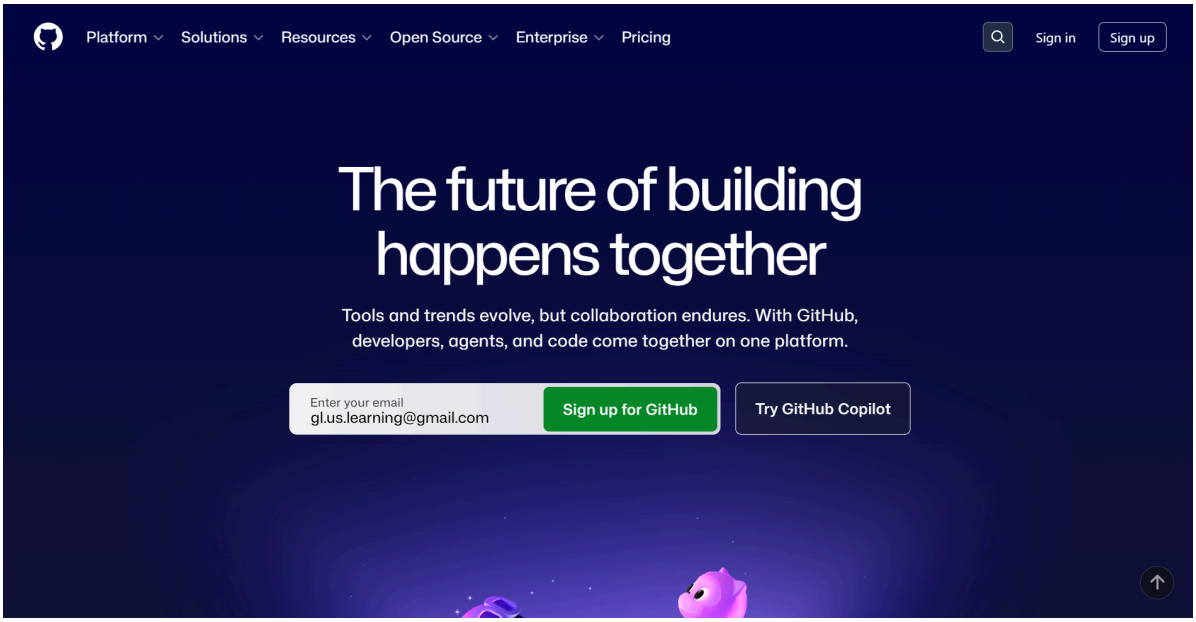

Open your browser and head over to https://github.com/. You will see the GitHub homepage with a large heading and an email field in the center of the page. This is where you start the sign-up process.

Step 2: Enter your email address

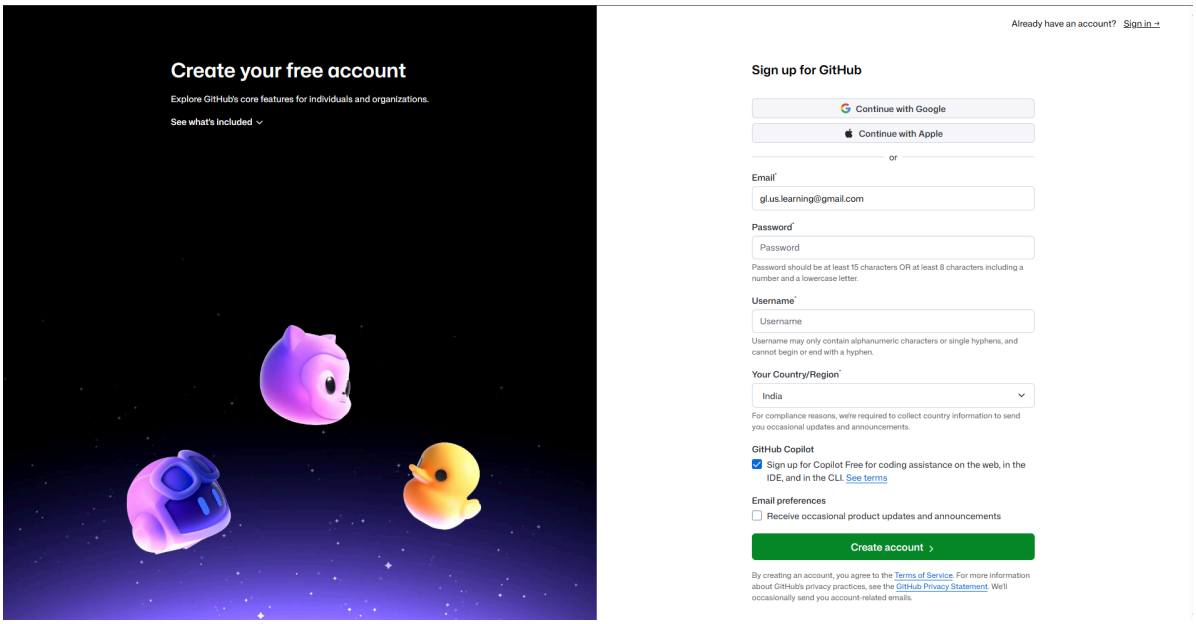

Type your email address into the "Enter your email" field on the homepage. Once you have typed it in, click the green "Sign up for GitHub" button right next to it. This will take you to the registration form.

Sharing or publishing the contents in part or full is liable for legal action.

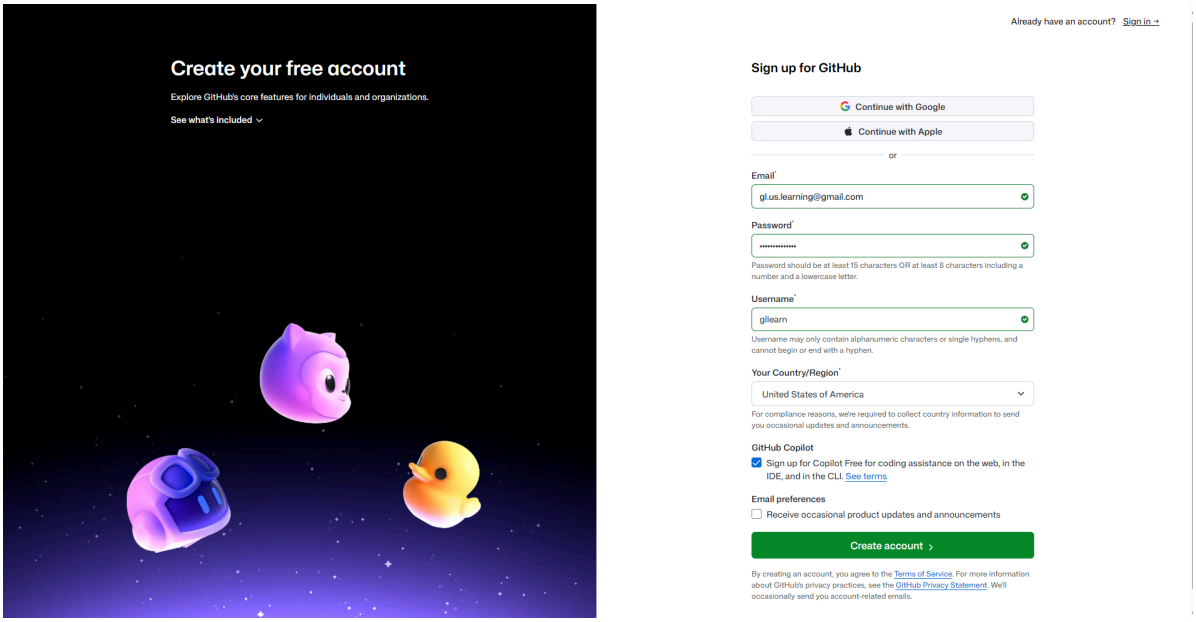

Step 3: Fill out the sign-up form

You will now see a registration form asking for a few details. Your email will already be filled in from the previous step. You need to set a password (at least 15 characters, or at least 8 characters with a number and a lowercase letter). Then pick a username. This will be your identity on GitHub, so choose something you are comfortable with. Usernames can only have letters, numbers, or single hyphens. Finally, select your country from the dropdown.

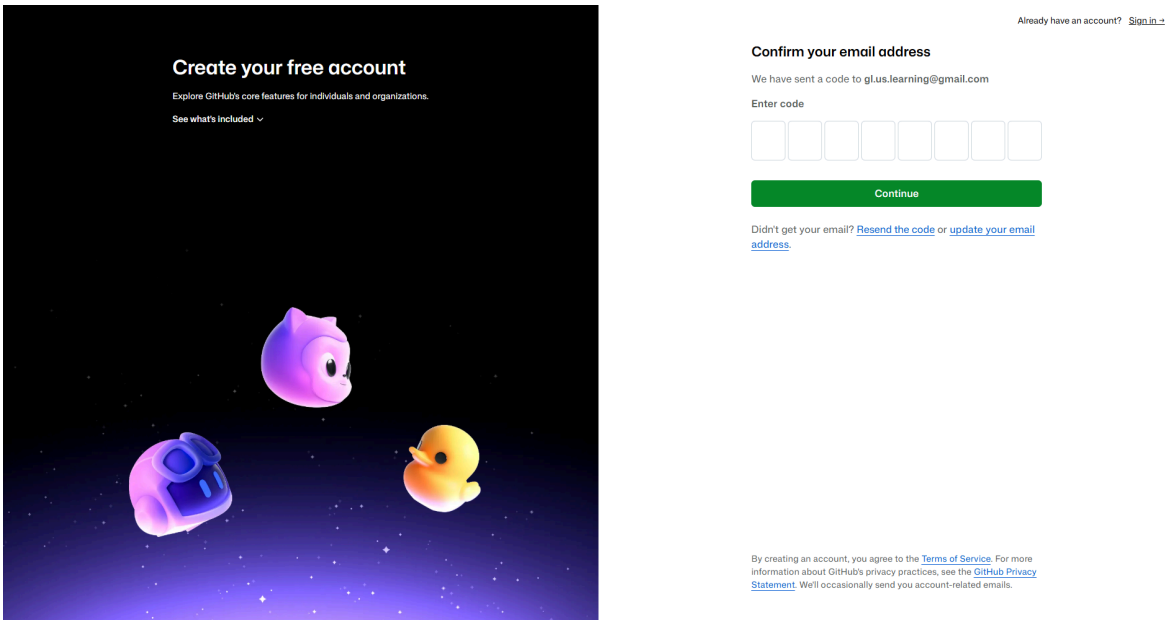

Here is what the form looks like once everything is filled in. Once everything looks good, click the green "Create account" button at the bottom.

Sharing or publishing the contents in part or full is liable for legal action.

Step 4: Verify your email address

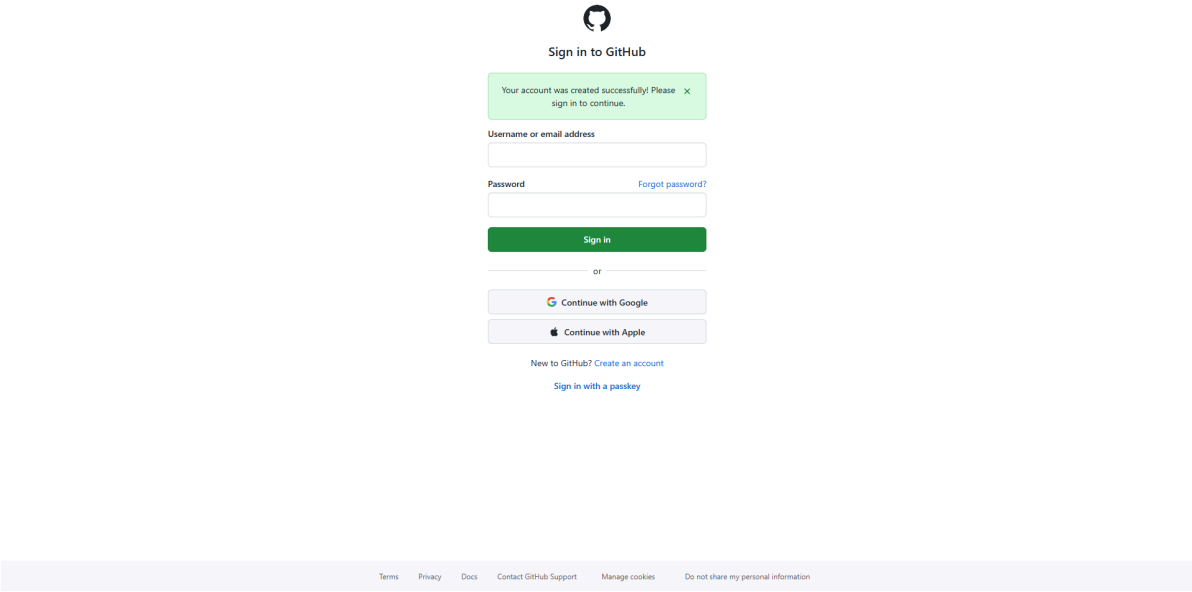

GitHub will send a verification code to the email address you provided. Go check your inbox for an email from GitHub. It will contain a six-digit code. Come back to this page and type in that code, then click "Continue". If you do not see the email, check your spam folder. You can also click "Resend the code" if needed.

Step 5: Sign in to your new account

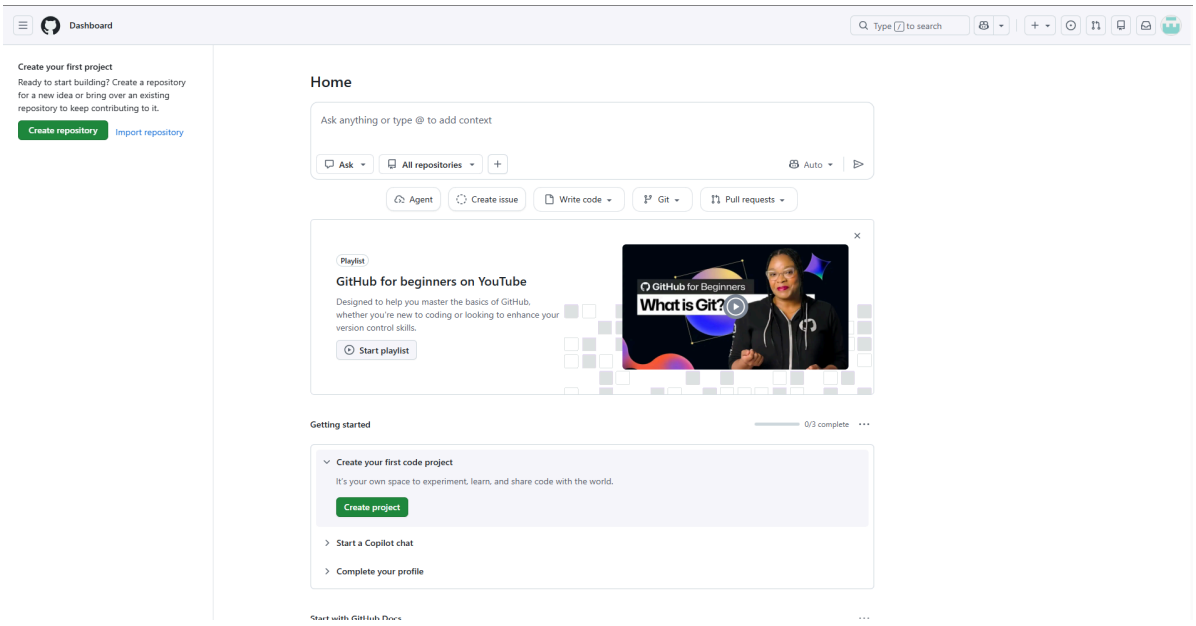

Once your email is verified, you will see a confirmation message saying your account was created successfully. Now sign in using the username (or email) and password you just set up. Click the green "Sign in" button.

This file is meant for personal use by alienrivero@gmail.com only.
Sharing or publishing the contents in part or full is liable for legal action.

Step 6: Welcome to the GitHub Dashboard

After signing in, you will land on your GitHub Dashboard. This is your home base. You will see options to create your first project, import a repository, and a "Getting started" checklist. Do not worry about any of that right now. Your account is ready to go.

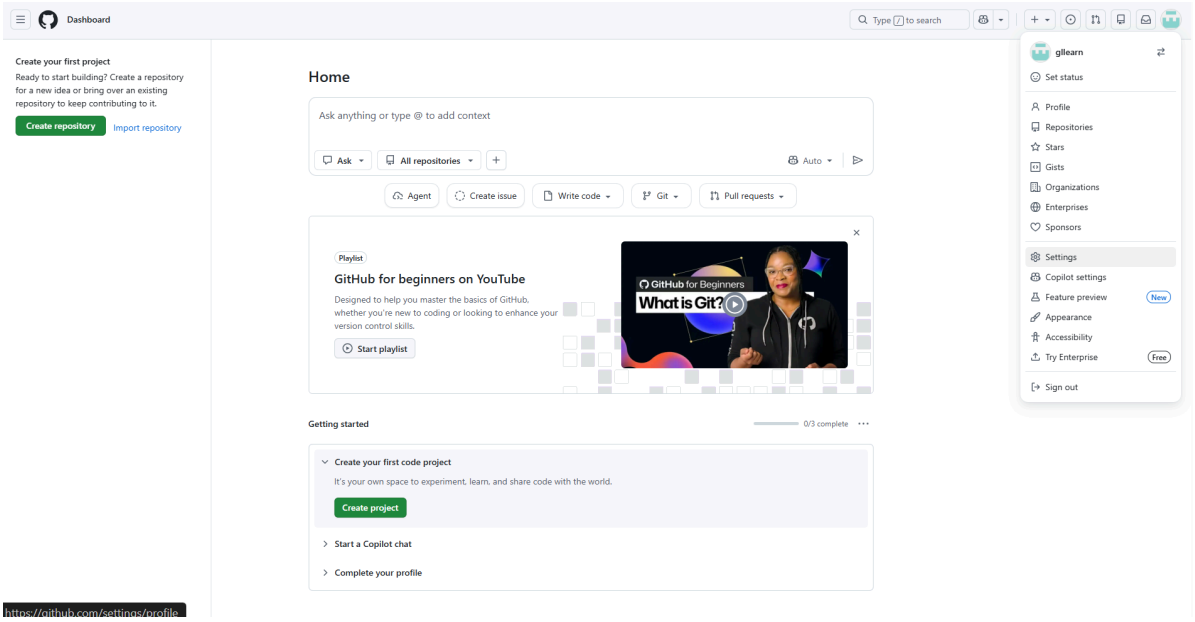

Part 2: Generating a Personal Access Token

This file is meant for personal use by alienrivero@gmail.com only.
Sharing or publishing the contents in part or full is liable for legal action.

A Personal Access Token (PAT) is like a special password that lets you interact with GitHub from outside the website. You will need this token later if you want to programmatically push files to GitHub. Let us set one up now so it is ready when you need it.

Step 7: Open your account Settings

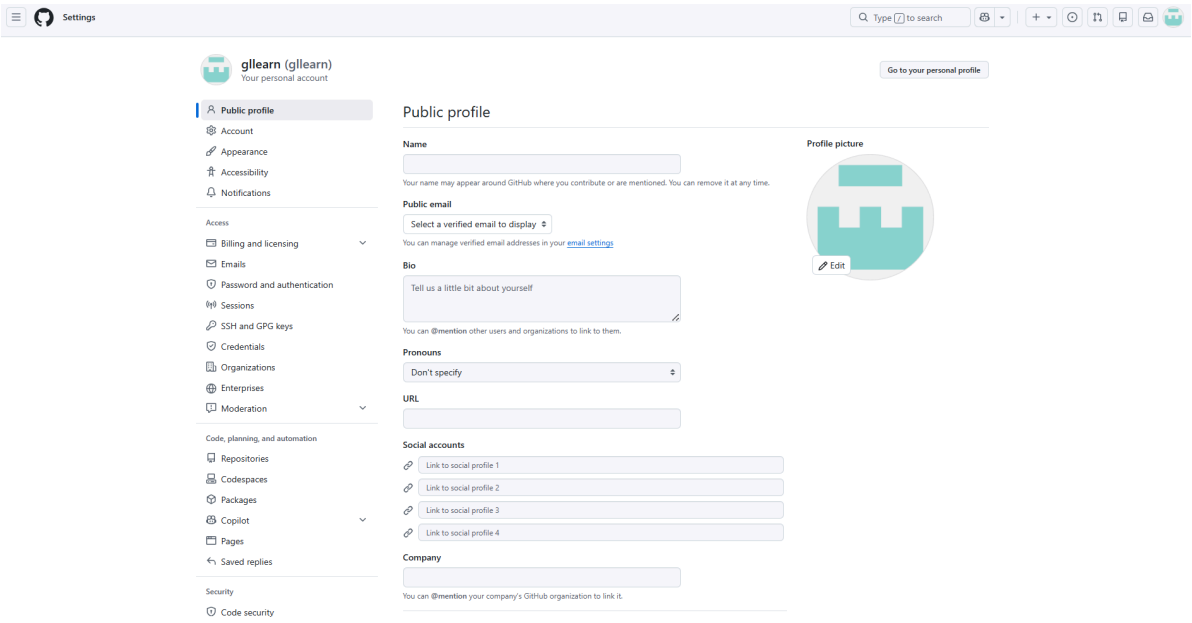

From the Dashboard, click on your profile picture in the top right corner of the page. A dropdown menu will appear. Click on "Settings" from this menu.

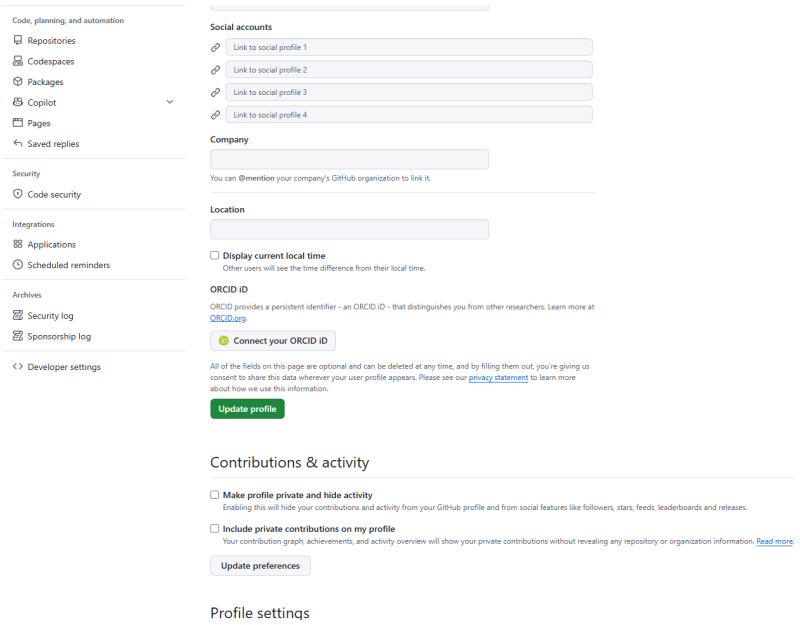

Step 8: Navigate to Developer Settings

You will land on the Settings page, which shows your Public Profile. On the left sidebar, you will see a bunch of options like Account, Appearance, Notifications, and so on. Scroll all the way down to the very bottom of this sidebar.

This file is meant for personal use by alienrivero@gmail.com only.
Sharing or publishing the contents in part or full is liable for legal action.

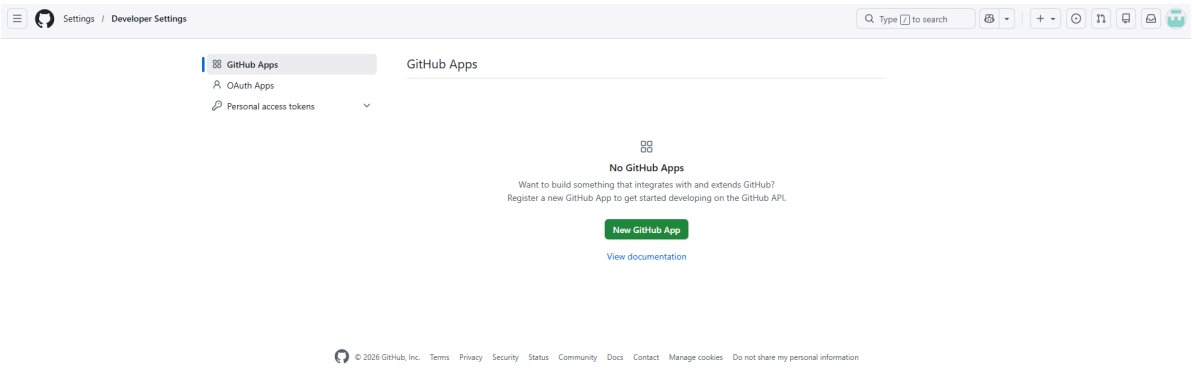

At the bottom of the sidebar, you will find "Developer settings" as the last item. Click on it. This is where all the token and app related settings live.

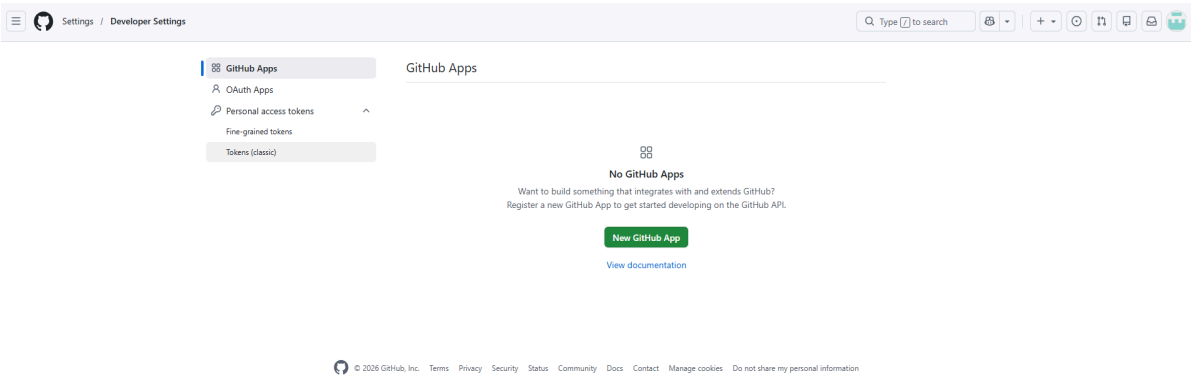

Step 9: Go to Personal Access Tokens

You will now see the Developer Settings page. On the left sidebar, you will see three options: GitHub Apps, OAuth Apps, and Personal access tokens. Click on "Personal access tokens" to expand it.

This file is meant for personal use by alienrivero@gmail.com only.
Sharing or publishing the contents in part or full is liable for legal action.

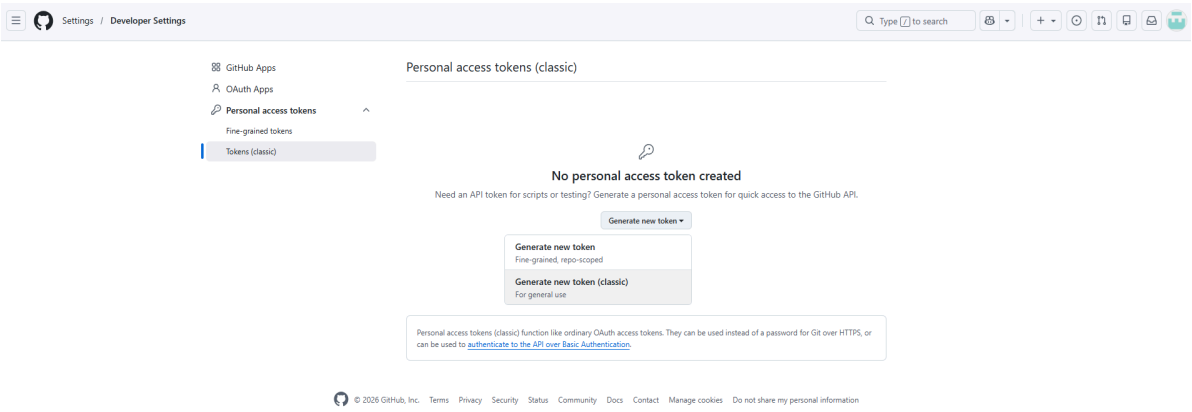

Once you expand Personal access tokens, you will see two sub-options: Fine-grained tokens and Tokens (classic). Click on "Tokens (classic)". Classic tokens are simpler to set up and work well for general use cases.

Step 10: Generate a new token

On the Tokens (classic) page, you will see a message saying no personal access tokens have been created yet. Click the "Generate new token" dropdown button, and then select "Generate new token (classic)" from the options that appear.

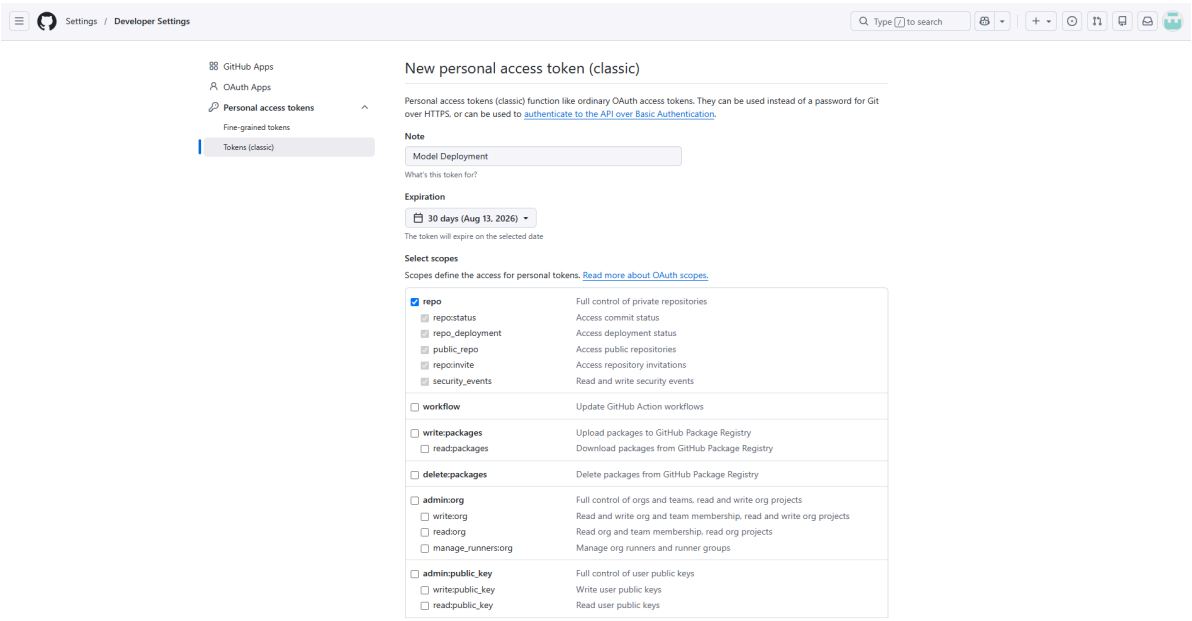

This file is meant for personal use by alienrivero@gmail.com only.
Sharing or publishing the contents in part or full is liable for legal action.

Step 11: Configure the token

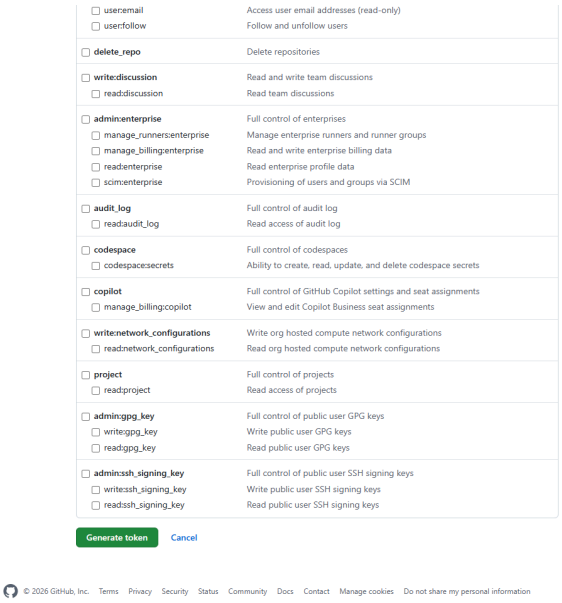

Now you need to fill in the details for your new token. In the "Note" field, give your token a descriptive name so you remember what it is for later. In this example, we are using "Model Deployment" as the note. Next, set the expiration. You can choose 30 days, 60 days, 90 days, or a custom date. For this example, we are going with 30 days.

Under "Select scopes", you need to check the boxes for the permissions your token should have. For pushing files to a repository, you will need the "repo" scope at minimum. Check the "repo" checkbox, which gives full control of private repositories (it automatically includes sub-permissions like repo:status, repo_deployment, public_repo, repo:invite, and security_events).

Sharing or publishing the contents in part or full is liable for legal action.

If you scroll down, you will see more scope options like workflow, packages, admin:org, and others. For now, you do not need to check any of these. Just make sure "repo" is selected. Once you are done, click the green "Generate token" button at the very bottom of the page.

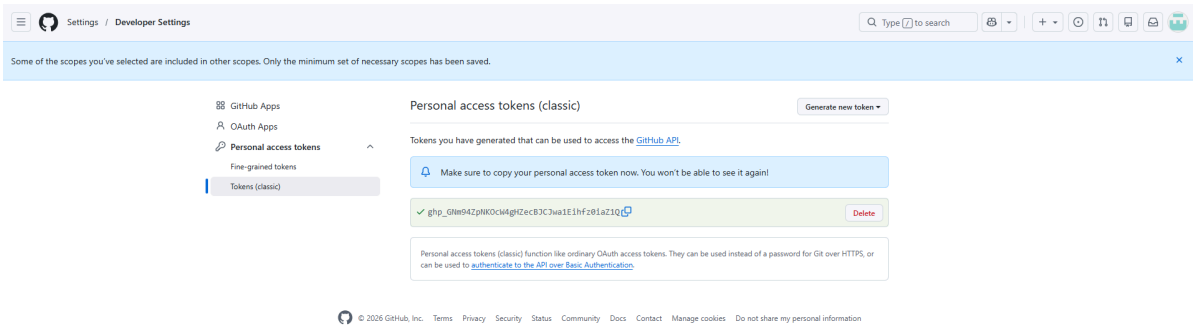

Step 12: Copy and save your token

Your token has been generated. You will see it displayed on the screen with a green checkmark next to it. This is extremely important: copy this token right now and save it somewhere safe. GitHub will only show you this token once. If you leave this page without copying it, you will never be able to see it again and you will have to generate a new one.

Click the clipboard icon next to the token to copy it. Then paste it into a secure location like a password manager, a private note, or a text file on your computer. Do not share this token with anyone, as it provides access to your GitHub account.

This file is meant for personal use by alienrivero@gmail.com only.
Sharing or publishing the contents in part or full is liable for legal action.

That is it. You now have a GitHub account and a Personal Access Token ready to use. Remember, the token works like a password, so keep it safe. If it ever gets compromised or expires, you can always come back to Developer Settings and generate a new one. When the time comes to push files to GitHub programmatically, you will use this token to authenticate instead of your regular password.
